

Using a Custom AMI to Launch Multiple EC2 Instances

1. **Sign in to the AWS Management Console.**
2. **Launch an Instance:**
 - Go to the EC2 dashboard.
 - Click on "Launch Instance" to start the instance creation process.
3. **Connect to the Server:**
 - Once the instance is up and running, connect to it using SSH.
 - Ensure that the data, packages, and services you need are installed and configured on the server.
4. **Verify Files and Services:**
 - Use the `ll` command to list files and directories.
 - Check if your services are running with the `systemctl status <service-name>` command.
 - If services are not running, start them using `systemctl start <service-name>`.
 - Verify the setup by accessing the application or service through the public IP address and port 80 in a web browser.
5. **Create a Custom AMI:**
 - Once your instance is configured, go to the EC2 dashboard, select your instance, right-click, and choose "Image and Templates" > "Create Image."
 - Provide a name and description for the image.
 - Configure storage options based on your requirements.
 - Click "Create Image" to generate the AMI. This AMI will include all your data, services, packages, and a snapshot of the instance.
6. **Launch New Instances Using the Custom AMI:**
 - When launching a new instance, go to the "My AMIs" section and select the custom AMI you just created.
 - Complete the instance configuration process, and launch the instance.
7. **Connect to the New Server:**
 - Once the new server is launched, connect to it using SSH.
 - Start the required services with `systemctl start <service-name>`.
 - Access the new server using its public IP address and port 80 to confirm that everything is working correctly.
8. **Using Launch Templates for Quick EC2 Deployment:**
 - To streamline the process, create a launch template with your custom AMI. This allows you to deploy EC2 instances without repeatedly entering configuration details.
 - When launching a new instance, select your launch template, which includes your custom AMI, and deploy the instance quickly.
